

Quality Improvement Plan Guidance: Workplace Violence Prevention

November 2017

Background

A health system with a culture of quality creates the conditions for staff to thrive, and ensuring their safety is one element of this.¹ Workplace violence is a high priority within Ontario's health care sector. The extent of this issue and its effect on workers in our health system has increasingly been recognized.

In response to this issue, the Ministry of Health and Long-Term Care and the Ministry of Labour established the Workplace Violence Prevention in Health Care Leadership Table to drive province-wide efforts to address workplace violence in Ontario's health care sector.

In May 2017, this Leadership Table released a report, [Preventing workplace violence in the health care sector](#), that includes 23 recommendations to make hospitals safer, reduce incidents of workplace violence, and improve attitudes and workplace safety culture. One of these recommendations was to include workplace violence prevention in the Quality Improvement Plans (QIPs) (see [Recommendation 19](#)).

Accordingly, the issue of workplace violence prevention will be integrated into the 2018/2019 QIPs submitted by hospitals, primary care organizations, long-term care homes, and local health integration networks (which oversee home care).

Workplace violence prevention will be incorporated into the QIPs in two ways: first, a free-text statement will be included in the QIP Narrative for all sectors (hospital, primary care, long-term care, and home care); and second, a mandatory indicator measuring workplace violence will be included in the QIP Workplan for the hospital sector only. The ultimate goal is to foster a culture of workplace safety across the health care sector in Ontario.

The purpose of this guidance

The purpose of this guidance is to support hospitals in meeting the expectations around the new mandatory workplace violence indicator that will be included in the 2018/19 QIPs for the hospital sector. Although primarily written for those in the hospital sector, this guidance also includes information that will be helpful for organizations in the primary care, long-term care, and home care sectors as they integrate workplace violence prevention into their QIPs.

This guidance was prepared in collaboration with Health Quality Ontario's Quality Improvement Plan Workplace Violence Prevention Guidance Task Group. Members are listed in Appendix A.

Addressing workplace violence prevention in the 2018/19 QIPs

Workplace violence prevention has been incorporated into the 2018/19 QIPs in two ways:

1. A free-text statement to be included in the QIP Narrative for all sectors (hospital, primary care, long-term care, and home care)
2. A mandatory indicator to be included in the QIP Workplan for the hospital sector only

1. Free-text statement in the QIP Narrative for all sectors

Leadership in your organization should strive to make workplace violence prevention a strategic priority.

All organizations that submit QIPs will be asked to answer the following question in their QIP Narratives:

Please describe how workplace violence prevention is a strategic priority for your organization. For example, is it included in your strategic plan or do you report on it to your board?

For hospitals, completion of this field is mandatory.

2. Mandatory indicator in the QIP Workplan for hospitals

For the hospital sector, a recent amendment to O. Reg. 187/15 under the *Excellent Care for All Act, 2010* effectively requires hospitals to complete certain mandatory indicators in their QIPs, to be specified by the Minister of Health and Long-Term Care upon the advice of Health Quality Ontario.

This indicator will measure the number of workplace violence incidents reported by hospital workers within a 12-month period.

Hospitals will also be asked to provide the number of employee full-time equivalents (FTEs) in their organization in order to provide context on the size of the organization (for example, to help understand the number of incidents in an organization with fewer than 500 employees versus an organization with more than 10,000 employees).

Full details about this indicator are outlined in the indicator technical specifications, attached as Appendix B.

Based on submitted QIPs, Health Quality Ontario will report back to the sector on the number of incidents of workplace violence in the context of hospital size, and the number of hospitals that have made workplace violence prevention a strategic priority for their organization. We will also share improvement activities related to workplace violence prevention that organizations highlight in their QIPs.

Improving reporting of incidents of workplace violence

The goal of addressing workplace violence is to foster a culture of reporting and ultimately reduce the number of violent incidents that occur. However, by necessity, the QIP indicator measures the number of *reported* violent incidents – and workplace violence is known to be underreported.²

As your organization improves reporting and develops a culture of safety, the number of reported incidents of workplace violence will rise. This effect is expected and should be encouraged. It will be necessary to look beyond the number of incidents reported to truly understand the types of incidents being reported and the broader issue of workplace violence within your organization. Strategies to do this are presented within this document.

How to use this guidance document

In this document, we have used Health Quality Ontario's Quality Improvement Framework to provide practical guidance on using quality improvement methodology to prevent workplace violence in the health care sector (Figure 1).

Figure 1. Health Quality Ontario's Quality Improvement Framework

Organizations may not necessarily follow these steps sequentially, as this framework describes an iterative process.

Read more about the [Quality Improvement Framework](#), including details and tools to support each step of the quality improvement process, on Health Quality Ontario's Quality Compass website.

1 Getting Started

Evidence suggests that quality improvement initiatives are most likely to be successful when there is strong organizational leadership, a supportive culture of improvement and team work³, and staff that are familiar with quality improvement methodology.⁴ The CEO, Board, and senior leadership have ultimate responsibility to protect workers from workplace violence, and should provide resources and support for the work to address workplace violence through the QIP. They will also be responsible for integrating workplace violence into your organization's strategic priorities.

Build your team

Addressing workplace violence requires an integrated approach. In addition to staff who are typically involved in your quality improvement work, you should include representatives from the Joint Health and Safety Committee on your team (as specifically indicated in [Recommendation 19 of the](#)

[Leadership Table's report: Workplace violence included in Quality Improvement Plans](#)). Include both workers and managers from the Joint Health and Safety Committee to fulfill both perspectives.*

Also consider including the following representatives:

- Patient advisors
- Senior leadership
- Human resources
- Professional practice
- Clinical ethicists

Review key resources

There are several key resources that can provide helpful overviews as you begin integrating workplace violence prevention into your QIP:

Workplace violence prevention

To learn about workplace violence prevention in the health care sector in Ontario, refer to:

- [Preventing workplace violence in the health care sector](#), the report of the Workplace Violence Prevention in Health Care Leadership Table (released May 2017)
- [The Public Services Health & Safety Association's Workplace Violence Prevention website](#), which includes information, tools, and resources related to workplace violence prevention
- The Ontario Ministry of Labour's guide, [Understand the law on workplace violence and harassment](#), along with the [Occupational Health and Safety Act, 1990](#) and [O. Reg. 67/93: Health Care and Residential Facilities](#)

Engaging patients

When preparing to engage with patients, refer to:

- Health Quality Ontario's guide, [Engaging with Patients and Caregivers about Quality Improvement: A Guide for Health Care Providers](#)
- The Workplace Violence Prevention in Health Care Leadership Table's handbook, [Engaging patients and families in workplace violence prevention: a handbook for organizational leaders in healthcare](#)

QIPs

Review the [annual QIP planning materials](#), which include:

- The QIP Guidance Document, which provides an overview of how the QIPs work; and
- The Indicator Technical Specifications (attached as Appendix B)

2 Defining the Problem

During this phase, your team will begin to understand your organization's current state with regard to incidents and risk of workplace violence. This includes reviewing your current data and reporting systems.

* According to the *Occupational Health and Safety Act, 1990*, hospitals are required to consult with their joint health and safety committee when developing, establishing, or putting into effect measures and procedures for the health and safety of workers. [O. Reg. 67/93, s. 8]

Collect data to understand the problem of workplace violence

Identify which reporting systems you have in place that already capture these measures

Data on the overall count of incidents of workplace violence might be captured in your patient relations systems, patient safety databases, workload complaint database, and/or Workplace Safety and Insurance Board/occupational health and safety databases.

Identify additional sources of data

- Employee engagement surveys or the Pre Risk Assessment Survey developed by the Workplace Violence Prevention in Health Care Leadership Table
- Security reports
- Code white reports
- Feedback from suggestion boxes or focus groups with workers
- Workplace inspection reports, grievances, and employee assistance support utilization
- Results of workplace risk assessments you have already conducted
- Workload complaints

3 Understanding Your System

In this phase, your team will thoroughly investigate data related to workplace violence incidents. To ensure you have a comprehensive approach, examine stratified data or analyze the consequences of workplace violence beyond the overall number of incidents. To understand the data, root and contributing causes of workplace violence need to be investigated. In doing this, your team should be able to create and finalize your measurement plan and set targets for improvement. The root causes that come to the forefront during this analysis will serve to focus your team's efforts as you work to design ideas for improvement (i.e., 'change ideas').

Look beyond the QIP mandatory indicator to understand changes in your performance

You may need to look beyond the QIP indicator in order to truly understand changes in performance. Consider collecting additional measures and including them as custom indicators. The data may also be used in process measures that will inform progress on specific change initiatives.

Consider collecting data according to categories of consequences

One way in which changes in performance can be understood is by using stratified data or subpopulations. As an organization works to improve reporting, the number of reported hazardous situations or near misses may initially increase as previously unreported incidents are increasingly reported and counted; however, the number of reported incidents with more serious consequences (which were likely already being reported) should stay the same or decrease. Stratifying your data provides more context and a better understanding of the nature of the incidents in your organization. Hospitals may want to consider adding custom indicators measuring the severity or consequences of incidents to their QIP.

The Ontario Hospital Association Workplace Violence Employee Incident Survey has used the following categories to stratify data on workplace violence based on escalating consequences, which are not mutually exclusive. These are already being captured in many hospitals:

Hazardous Situation – A report of an unsafe situation(s), environment or practice that could contribute towards an incident or accident occurring (e.g., communication of a

history of violence did not occur; potential risk to staff not identified in patient chart and communicated).

Near Miss – where an incident occurred but did not result in an injury/illness (e.g., patient tosses food tray towards worker but doesn't make contact with the worker)

First Aid – No lost time (NLTI) injury or illness, requiring first aid treatment.

Health Care Only – No lost time (NLTI) reported injury, where the worker required health care treatment but did not miss work. Health care is defined as treatment provided at hospitals and health facilities and/or services that can only be provided by one of the following health care professionals: chiropractor, physician, physiotherapist, registered nurse (extended class), or dentist.

Lost-Time Injury/Illness – A worker suffers a work-related injury/illness which results in the worker being off work past the day of accident, loss of wages/earnings.

Critical/Reported to Ministry of Labour – As per the Occupational Health and Safety Act's definitions and requirements. Any critical incidents reported should also be captured as First Aid, Health Care Only, or Lost Time Injury/Illness as well.

As mentioned in the recommendations of the Workplace Violence Prevention in Health Care Leadership Table, stratifications for the QIP indicator according to the consequence of violence may be considered in the future.

Analyze data and identify opportunities for improvement

Consider the following approaches to understand your system more fully:

- Hold a [Kaizen event](#). Compare your current processes to the Leadership Table's recommendations and complete a gap analysis.
 - This may help you to identify processes that could be redesigned to prevent workplace violence, and will allow the entire team to become familiar with the processes.
- Conduct an analysis of the root and contributing causes of workplace violence. The Joint Health and Safety Committee should be involved (see Recommendation 4 from the [Preventing workplace violence in the health care sector report](#)).
 - Consider using tools such as fishbone diagrams ([Instruction Sheet](#) | [Worksheet](#)) or the 5 Whys ([Instruction Sheet](#) | [Worksheet](#)) as you conduct these analyses.
- Create a Pareto chart of the categories of workplace violence, and complete a failure mode and effects analysis (FMEA) or an [impact effort matrix](#) to inform your priorities for improvement.
- Engage your workers, patients, caregivers & families, unions, Joint Health and Safety Committee, and other community stakeholders throughout this process to help you identify areas of priority and potential change ideas.

Risk assessments

Workplace risk assessments can help you to identify risks of harm in the workplace and determine what precautions might be required to control these risks. They are an important tools to understanding your system and designing possible solutions. Different risk assessment tools are available; for example, the Public Services Health & Safety Association has developed Workplace Violence Risk Assessment Toolkits for [Acute Care](#), [Community Care](#) and [Long-Term Care](#) that may be helpful.

Set targets for improvement

Zero incidents of workplace violence is the theoretical best for this indicator. However, this is may not be a realistic goal if you are in the early stages of addressing workplace violence and are working to build a culture that supports incident reporting. You may not know whether to expect a net increase in the number of incidents of workplace violence (due to increased reporting) or a net decrease (due to a true reduction in workplace violence). If your organization's focus is to improve your reporting culture, you may opt to target to increase the number of incidents (especially if you are able to also include information about any of the stratifications included in Understanding Your System). On the other hand, if your organization's reporting culture is well-developed, you may opt to target to decrease. For other organizations, in this first year, it may be appropriate to set a target of "collecting baseline" for this indicator.

Whatever target you select, it's important to provide a thorough explanation in the Target Justification section of the QIP Workplan. You can also discuss this in the QIP Narrative. A thorough explanation will help your reader to understand why you may not be targeting to decrease the number of reported incidents of workplace violence at this stage of your work.

4 Designing and Testing Solutions

In this phase, your team will have the opportunity to design and test different improvement ideas that directly address the root and contributing causes of workplace violence you have identified.

Design change ideas to address workplace violence

Look to existing recommendations and resources for addressing workplace violence

There are many approaches to addressing workplace violence that have already been applied in the Ontario context. The table below offers a few key change ideas and resources for addressing workplace violence that will be used by many organizations across the province.

Change ideas from the Recommendations of the Workplace Violence Prevention in Health Care Leadership Table's report, [Preventing workplace violence in the health care sector](#)

- **Recommendation 3.** [Embark on a journey to create psychologically safe and healthy hospitals](#). Adopt voluntary standard CSA Z1003, Psychological Health and Safety in the Workplace. The standard encourages organizational leaders to strive towards psychologically safe and healthy workplaces, providing capacity for quality improvement activities.
- **Recommendation 14.** Engage patients, families, and staff in identifying triggers, behaviours, and interventions. [Triggers and care planning in workplace violence prevention](#) is a resource that will assist with identification of triggers and development of care plans to mitigate workplace violence risks.
- **Recommendations 16 and 17.** Identify worker learning needs, using the [training matrix](#), and link to resources such as those related to [responsive behaviours and complex needs](#) available from brainXchange.
- **Recommendation 20.** [Creation of consistent communication protocols between external care environments](#). Creating consistent communication protocols to address and/or document the potential for patient triggers, responsive behaviours, and/or interventions will help to limit the

risk of violence to health care workers and patients as patients transition from one organization to another (e.g., from a long-term care home to a hospital).

Resources from the Public Services Health & Safety Association's Violence, Aggression, & Responsive Behaviour Project

The Public Services Health & Safety Association has developed several toolkits through their [Violence, Aggression, & Responsive Behaviour Project](#). These toolkits provide practical, step-by-step instructions for assessing the workplace for risks and mitigating the risks that are identified. They are available for the acute care, home/community care, and long-term care sectors:

- [Individual client risk assessments](#)
- [Flagging](#)
- [Security](#)
- Personal safety response systems (*not yet released*)

Upcoming resources

- The Registered Nurses' Association of Ontario is currently working to update their Best Practice Guideline on [Preventing and Managing Violence in the Workplace](#)

See Health Quality Ontario's [Quality Compass](#) for more change ideas, measures, and references.

Learn about what other organizations across the province are doing

Your team can use [Query QIPs](#) to learn what other organizations are doing to address workplace violence as reported in their QIPs. This website allows you to run reports to see what change ideas organizations are implementing and how this corresponds to their performance. Could you implement any of these ideas in your area?

Describe your change ideas and associated process measures in your QIP

Once you select the change ideas you will be testing, you can enter them in the QIP online submission tool (QIP Navigator), in the Workplan Indicator row on Workplace Safety under the Planned Improvement Initiative column. Describe how you are implementing these change ideas in the Methods column. You will need to include at least one process measure for each change idea.

Test change ideas to determine whether they are resulting in improvement

Use Plan-Do-Study-Act (PDSA) cycles ([Instructions](#) | [Worksheet](#)) to test whether the change ideas you are using are resulting in improvement.

You may need to design and use process measures specific to the change ideas you are working on. For example, if you plan to provide training, you will want to measure the percent of staff who have received the training as a process measure.

5 Implementing and Sustaining Changes

During this phase, you will formally implement the change ideas that have successfully resulted in improvement into everyday practice in your unit or department.

Formalize a robust reporting system

Ensuring that all staff members adopt the changes requires a robust reporting system to monitor adoption and make the data visible to workers and leadership. [Recommendation #18 Reporting systems](#) suggests you leverage data you are already collecting.

It is important to recognize that the number of reported incidents is likely to rise initially as a culture of safety and improvement are realized. This may be a positive sign of increased reporting.

Communicate and publicly share data on workplace violence

Data on workplace violence need to be visible to the improvement team. Providing feedback on the progress achieved (or not achieved) allows the team, as well as the affected staff, to celebrate their success or take action to resolve any issues. Public communication will facilitate ongoing buy-in and participation in the efforts to prevent workplace violence.

As you develop these communications, be sure to include messaging about the importance of reporting all incidents of workplace violence. Consider framing this as part of the organization's overall work on quality.

Integrate workplace violence prevention into standard organizational practices

Build information about workplace violence prevention activities into orientation programs and policy and procedure manuals, and add accountabilities to job descriptions. Reminder systems, audits, and tools such as checklists may keep the new processes top-of-mind and reduce the chance of errors.

6 Spreading Change

Often, change ideas are initially implemented in specific units, and will need to be rolled out to the entire organization. Once the change has been implemented organization-wide, think about how you might spread the change to other organizations.

Spread successful change ideas within your organization

Consider the following when developing a spread plan for your organization: What specific workplace violence prevention strategies need to be spread to which areas, and by whom?

Enlist more leaders to operationalize the changes in different environments, but keep a clear line of communication to the team and the Joint Health and Safety Committee.

Spread the change and share your lessons learned outside your organization

The recommendations outlined in the report of the Workplace Violence Prevention in Health Care Leadership Table will require system-level collaboration in order to create safe work environments for all workers in the hospital sector.

Look for opportunities to collaborate and partner with other groups and organizations as you address this important issue. Consider participating in [Quorum](#), Ontario's health care quality improvement community. On Quorum, you can start a group to collaborate on workplace violence initiatives, share

your lessons learned from a particular project, or ask a question of the quality improvement community.

Appendix A. Health Quality Ontario's Quality Improvement Plan Workplace Violence Prevention Guidance Task Group

Name(s)	Organization
Sudha Kutty (<i>Chair</i>)	Health Quality Ontario
Terri Aversa, Dave Lundy	Ontario Public Service Employees Union
Rachel Bredin	Ontario Hospital Association
Erna Bujna	Ontario Nurses' Association
Andréane Chénier	Canadian Union of Public Employees
Sonja Glass	Member, QIP Advisory Committee
Joanna Noonan	Kingston Health Sciences Centre
Peter Smith	Institute for Work and Health
Cathy Stark	London Health Sciences Centre
Henrietta Van Hulle	Public Services Health & Safety Association

Appendix B. Indicator technical specifications for the mandatory indicator for hospitals: Number of workplace violence incidents

Indicator Name NEW	Number of workplace violence incidents (Overall)
Mandatory, Priority /Additional indicator?	Mandatory
Dimension	Safety
Direction of Improvement	If your organization is focused on building your reporting culture, your QIP target for this indicator may be to increase the number of reported incidents. If your organization’s reporting culture is already well-developed, your QIP target may be to decrease the number of incidents occurring.
Type	Outcome
Description	This indicator measures the number of reported workplace violence incidents by hospital workers (as by defined by OHSa) within a 12 month period
Unit of Measurement	Number of workplace violence incidents reported by hospital workers
Calculation Methods	Number of workplace violence incidents reported by hospital workers within a 12 month period Inclusions: The terms “worker” and “workplace violence” as defined by under the Occupational Health and Safety Act (OHSa, 2016)
Numerator	N/A
Denominator	N/A
Risk adjustment	N/A
Current performance: reporting period	January – December 2017
Data source	In house data collection The number of reported workplace violence incidents is available via your organization’s internal reporting mechanisms.
How to access data	Hospitals are encouraged to use their in-house hospital incident and patient safety reporting systems for determining the number of reported workplace violent incidents
Comments	For quality improvement purposes, hospitals are asked to collect data on the number of violent incidents reported by workers, including physicians and those who are contracted by other employers (e.g., food services, security, etc.) as defined by the Occupational Health and Safety Act. Worker means any of the following: <ul style="list-style-type: none"> • A person who performs work or supplies services for monetary compensation. • A secondary school student who performs work or supplies services for no monetary compensation under a work

experience program authorized by the school board that operates the school in which the student is enrolled.

- A person who performs work or supplies services for no monetary compensation under a program approved by a college of applied arts and technology, university or other post-secondary institution.
- A person who receives training from an employer, but who, under the Employment Standards Act, 2000, is not an employee for the purposes of that Act because the conditions set out in subsection 1 (2) of that Act have been met.
- Such other persons as may be prescribed who perform work or supply services to an employer for no monetary compensation.

Workplace violence is defined as the exercise of physical force by a person against a worker, in a workplace, that causes or could cause physical injury to the worker. It also includes an:

- attempt to exercise physical force against a worker in a workplace, that could cause physical injury to the worker; and a
- statement or behaviour that a worker could reasonably interpret as a threat to exercise physical force against the worker, in a workplace, that could cause physical injury to the worker

For more information please see the following resources to identify recommended practices and change ideas, key terms, references, etc.:

[Preventing Workplace Violence in the Health Care Sector Report](#)

[Ministry of Labour Workplace Violence and Harassment Key Terms and Concepts](#)

While there is no denominator for this indicator, organizations are asked to include the total number of hospital employee full-time equivalents (FTE) in the measures section of the QIP Workplan. This information will be useful to support QIP analysis and interpretation (e.g., organizational size). Full time equivalence data is accessed via hospitals human resource information systems and, by definition, may not necessarily include all 'workers' included in the indicator.

If the count of incidents is ≤ 5 the value will be suppressed.
